

# CAPTIVE AND WILD BORN LEMURS

Hey stranger, during analyzing Lemurs data as a part of TidyTuesday challenge I noticed that Wild born animals are more 'happy' in terms of life expectancy and weight. But maybe there is a reason for that? Let's see!

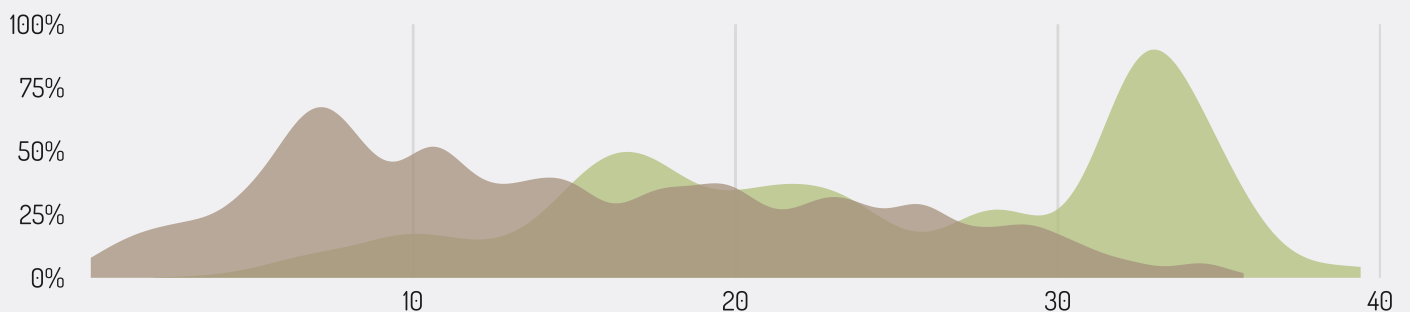

## WEIGHT, G

We can see that the peaks are in different sides of the distribution. But maybe there is another variable influencing them?

## AGE, YEARS

Wild born lemurs representatives are in general older than Captive ones. We should stratify before comparison

## WEIGHT BY AGE GROUPS

Here we go: if analyze by age groups, median Weight is not that different. Note: we excluded groups with small number of observations
